

Restoring Europe's Rivers

The RESTORE project is made possible with the contribution of the LIFE+ financial instrument of the European Community

and works in partnership with

SESSION 07:

River Restoration Techniques

Martin Janes

Managing Director

The River Restoration Centre (UK)

RESTORE West Region Lead

Session Introduction

- large number of techniques and approaches,
- work with natural processes,
- catchment scale approach,
- work at different scales,
- what techniques are available and
- some exciting examples of best practice.

Working with natural processes

- Longitudinal processes:
 - Hydrology
 - Fluvial geomorphology
- Lateral processes:
 - Interactions with riparian zones & floodplains
- Internal processes:
 - Predation, competition, life cycle etc.

Pite River, Sweden

Representation of degradation and restoration trajectory, based on the strength of connectivity.

[The size of each point represents the relative variability in annual flow resulting at each phase]

Phase 1 pre-degradation;
Phase 2, channel simplification and revetments (1870), for log floating;
Phase 3, impoundments (1930);
Phase 4, restoration (revetment removal and structures to recreate complex in-stream habitat).

(Kondolf et al 2006)

UK River restoration techniques

Top 10 techniques used in UK river restoration projects

<u>River restoration techniques</u>	No. of UK projects (NRRI)
River narrowing to increase velocity (by adding structures)	404
Lakes, ponds, wetlands restored or established	324
Obstructing structure replaced/removed	293
Bank re-profiling/hard bank removal	292
Riparian/floodplain vegetation (planting/management)	283
Re-meandering or restoring sinuosity	206
Daylighting/culvert removal	156
River-floodplain reconnection	129
Long section habitat enhancement (pool/riffle sequences)	154
Backwaters and pools established/reconnected	137

Techniques across Europe

Common techniques used in Europe-wide river restoration

<u>River restoration techniques</u>	No. of UK projects (NRR1)	No. of EU projects (Wiki)
River narrowing to increase velocity (by adding structures)	404	21
Lakes, ponds, wetlands restored or established	324	61
Obstructing structure replaced/removed	293	57
Bank re-profiling/hard bank removal	292	50
Riparian/floodplain vegetation (planting/management)	283	52
Re-meandering or restoring sinuosity	206	69
Daylighting/culvert removal	156	7
River-floodplain reconnection	129	15
Long section habitat enhancement (pool/riffle sequences)	154	53
Backwaters and pools established/reconnected	137	9

Map of case studies

Left click to look around in the map, and use the wheel of your mouse to zoom

What you can do:

- You can search the database to find case studies by using the different categories: country; monitoring or implementation costs and many more: [click here to search for a case studies](#)
- Please also add your own river restoration scheme to the database: [click here to create a new case study](#).
- Provide us with your feedback: [click here to take the survey](#) or add to the discussion pages.

Countries

The following countries are members of the RESTORE partnership. Click any of the links below to view information about that country.

Austria, Belgium, Bulgaria, Denmark, England, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Netherlands, Northern Ireland, Norway, Poland, Portugal, Romania, Scotland, Slovenia, Spain, Sweden, Wales

The right techniques

- Understanding the processes and pressures
- Setting clear and measurable objectives
- Consider multiple benefits and outcomes
- Pick techniques to restore natural processes
 - Long term success and low management needs
 - Alter to make appropriate to the river type
- Monitor and evaluate their success
- Inform the wider evidence base for the future

But where can I find.....??

- **REFORM (FP7)** – scientific evidence base, reviews, assessments, tools and frameworks (reformrivers.eu)
- **Healthy Catchments** - how to manage water for flood risk & the WFD (restorerivers.eu)
- **Manual of River Restoration Techniques** – good practice in river restoration techniques (theRRC.co.uk)
- **RESTORE** – partnership for sharing knowledge and promoting best practice on river restoration in Europe
- **ECRR** – supporting river restoration networks across Europe
- **RiverWIKI** – interactive database of restoration projects

Environmental improvements & case studies

River Basin Management Plans (RBMPs) identify which environmental improvements need to be undertaken in specific water bodies. Environmental improvements are grouped into similar activities

There are at least 3 case study examples for each environmental improvement, which demonstrate how it could be implemented. Case studies can be found by clicking links to the left or by viewing environmental improvement by group (below).

When you click on each of the environmental improvements listed there will also be an explanation of what the environmental improvement involves, including:

- Case study examples on the right of the page
- An assessment of the multiple benefits provided by each case study
- An indication of cost

Habitat creation

Creating new compensatory habitat to mitigate for the impacts on habitats of FCERM schemes undertaken elsewhere within a region/catchment. This group has one environmental improvement:

CASE STUDY

Improve channel geomorphology to create habitat

Project Summary

Title: River Quaggy enhancement scheme at Chinbrook Meadows
Location: River Quaggy, London Borough of Lewisham, England
Technique: Structure removal, channel realignment and natural enhancement
Cost of technique: ££££
Overall cost of scheme: ££££
Benefits: ££
Dates: 2002

Mitigation Measure(s)

Use of green engineering techniques instead of hard bank protection
 Improve channel geomorphology to create habitat

How it was delivered

Delivered by: Environment Agency
 Partners: Quaggy Waterways Action Group; Lewisham Council

WFD Terminology

Throughout this section of the RESTORE webpage the term 'environmental improvement' is used instead of WFD 'mitigation measures'. The names of some mitigation measures are different in England, Scotland and Northern Ireland.

Restoring Meanders to Straightened Rivers

1

Design

The scheme was designed to allow natural processes to shape the channel's features, rather than focusing on creating individual habitat areas. The new channel was over-sized compared to the existing straight cut, to allow space for the natural features to develop. It was also anticipated that the burn would actively adjust its course within the wide corridor between the old cut to the north and a knoll and new spoil bunds to the south (Figure 1.8.1).

Figure 1.8.1

MONTAGE SHOWING NEW CHANNEL AND OLD COURSE - 29TH AUGUST 2012. AERIALS © SEPA

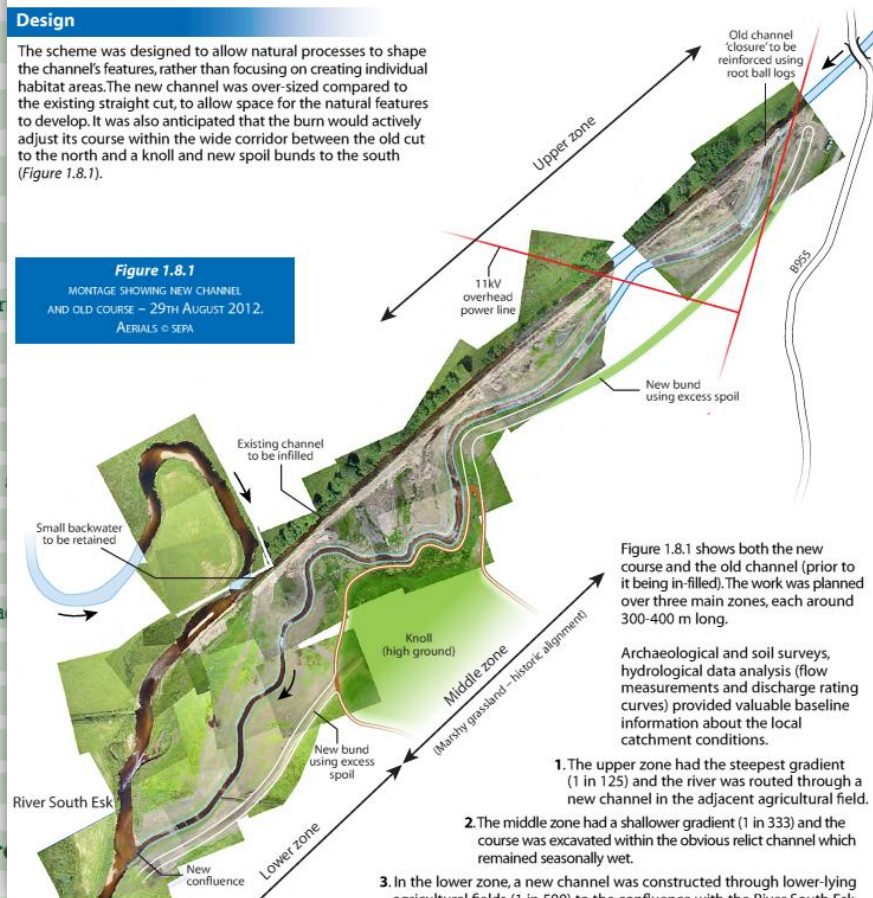

Figure 1.8.1 shows both the new course and the old channel (prior to it being in-filled). The work was planned over three main zones, each around 300-400 m long.

Archaeological and soil surveys, hydrological data analysis (flow measurements and discharge rating curves) provided valuable baseline information about the local catchment conditions.

1. The upper zone had the steepest gradient (1 in 125) and the river was routed through a new channel in the adjacent agricultural field.
2. The middle zone had a shallower gradient (1 in 333) and the course was excavated within the obvious relict channel which remained seasonally wet.
3. In the lower zone, a new channel was constructed through lower-lying agricultural fields (1 in 500) to the confluence with the River South Esk.
